

Laser Therapy with Erchonia Low Level Laser

General Info

- The Erchonia low level laser is a cold laser that energizes the cells to stimulate healing, increase range of motion, resolve inflammation, and provide pain relief.

How does it Work?

- Life is dependent on light. Similar to photosynthesis, the laser uses frequency to deliver photons into the cells to cause a photochemical reaction. The photons are absorbed by the mitochondria ("Powerhouse of the cell") to create Adenosine Triphosphate (ATP), or energy, to power the cell.

Recommended Treatment Schedule

- The first two laser treatments should be 90 minutes apart. After that, treatments should continue twice a week.
*Unless directed otherwise by the doctor
- **Number of Treatments**
 - Acute conditions: 4-6+ treatments
 - Chronic conditions: 8-12+ treatments

FAQ

- **Is laser therapy safe?**
 - The FDA has cleared the laser for the use of treatment in the veterinary field. The only precaution is the option to wear light filtering glasses.
- **Are there any adverse side effects?**
 - Some patients can experience some drowsiness after the initial two treatments.
- **Why is the Erchonia laser better than the one I can buy online?**
 - Only certified professionals can buy the Erchonia laser. This laser can penetrate through the skin to reach deeper tissues and has clinical studies proving the effectiveness compared to the heat lamp devices that do not.
